Use your results to answer the following questions:

- Which algorithm or algorithms would be most appropriate for planning in a very restricted domain (i.e., one that has only a few actions) and needs to operate in real time?
→greedy_best_first_graph_search - h_unmet_goals
- Which algorithm or algorithms would be most appropriate for planning in very large domains (e.g., planning delivery routes for all UPS drivers in the U.S. on a given day)
→astar_search - h_pg_levelsum
- Which algorithm or algorithms would be most appropriate for planning problems where it is important to find only optimal plans?
→breadth_first search
